

Kirill Cherednichenko | Senior Backend Developer (PHP)

+84 36 648 9942 | chekirilla@gmail.com | github.com/4irik | linkedin.com/in/kirill-cherednichenko | 4irik.github.io/log/en

SUMMARY

- Senior Backend Developer with 14+ years of professional web development experience, mostly in PHP.
- I work on backend systems where architecture, reliability and business logic matter — from building new services from scratch to evolving and modernizing existing systems.
- I focus on making systems easier to understand, test and change: defining clear contracts and boundaries, making dependencies explicit, isolating business logic, improving observability and automating repetitive operational work.
- I'm interested in backend roles involving architecture, complex business logic, APIs and integrations, reliability, and building systems that can evolve as requirements change.

SKILLS

Languages & Frameworks: PHP, Symfony, Yii2, Slim, PHPUnit, Codeception, PHPStan, Doctrine ORM, ReactPHP, RoadRunner, **Databases & Search:** PostgreSQL, MySQL, Redis, Elasticsearch, ClickHouse, **APIs & Integrations:** REST APIs, gRPC, API Design, OpenAPI, Payment Integrations, **Messaging & Distributed Systems:** RabbitMQ, Kafka, Centrifugo, **DevOps & Observability:** Docker, CI/CD, Deployer, ELK Stack

EXPERIENCE

Senior Backend Developer / Technical Owner | IPSM (ipsm.kz), fixed-scope freelance project, remote **03.2026 – 04.2026**

International Kazakh-Israeli postgraduate medical education project (International Postgraduate School of Medicine), run jointly with Kazakh medical universities and the Israeli organization IHEA. Sole technical owner of a donation backend built from scratch on the Tarlan Payments gateway (PHP 8.3, Slim 4, PHP-DI, SQLite), covering architecture, payment logic, background jobs, API contract, testing, deployment and handover.

- Delivered the payment core in 3 days: one-time and recurring payments, callback processing with centralized signature verification in middleware, and transaction storage.
- Built monthly subscriptions with card linking, recurring charges, retries and donor self-service cancellation.
- Established OpenAPI 3.1 as the shared contract for backend code and tests, with automated request validation and consistent API errors.
- Made payment creation idempotent and protected CLI commands from concurrent or duplicate execution, including database migrations during deployment.
- Added a Telegram bot for operational access to donation and subscription data, including CSV exports.
- Improved observability by centralizing HTTP and CLI error logging and capturing payment gateway requests and responses for integration diagnostics.
- Enabled client deployments without engineer involvement by automating application deployment, migrations and rollback with Deployer.
- Covered key payment flows with unit, integration and API tests, backed by static analysis and automated code-quality checks.
- Used Claude Code and Codex as development agents under repository-level rules, shared skills and explicit security checks for payment-related code.

Senior Backend Developer | Confidential, crowdsourcing platform (NDA), remote **12.2024 – 03.2026**

Private venture fund & development lab whose products are world leaders in their niches with 10M+ active users (international high-load B2C and B2B services: exchanges, SaaS, ML, Computer Vision, AI). Backend development of a modular PHP 8 / Yii2 platform for a crowdsourcing task marketplace; the application shell composes business modules from Git submodules and Composer packages.

- Enabled isolated testing of key modules by replacing implicit service dependencies with dependency injection.
- Separated database queries from business logic through a repository layer over ActiveRecord.
- Designed a common module for task verticals: specialized task modules plug in through interface contracts without changes to the core.
- Implemented a state machine for tasks and executions: a graph of allowed transitions with guard rules from creation and moderation to completion, dispute, acceptance or rejection.
- Implemented time-targeted task scheduling with period-overlap validation and automatic switching, plus automated task promotion.
- Implemented multi-currency payouts and refunds on internal accounts, including currency conversion when the active account currency changes; preserved billing correctness for paid badges across currency changes.
- Identified and fixed a dispute-handling defect that could cause a negative balance after a task price increase.
- Built a modular messenger with extensible access rules, covered by unit, functional and acceptance tests.
- Established automated quality gates with PHPStan, PHP CS Fixer, commit validation and separate Codeception configurations for different test layers.

Senior Backend Developer | VK (VKontakte, vk.com), content team, remote **04.2023 – 07.2023**

Russia's largest social network by user count. MAU — 93.4M, DAU — 62.7M (2026 data).

- Implemented photo editor analytics: processed client events server-side, mapped client parameters to ClickHouse types and integrated them into the event pipeline; identified a type mismatch between the event schema and the analytics table.
- Built backend APIs for ML-powered photo editing: segmentation masks with access and input validation, and asynchronous photo enhancement with worker-based processing; documented both APIs.
- Rolled features out gradually through experiments and feature flags, monitoring API errors, RPC metrics and Sentry.
- Extended the AR masks service with per-mask capability flags while preserving backward compatibility: older clients that did not support new capabilities continued to receive only compatible masks.
- Automated Jira ↔ internal A/B platform synchronization: experiment statuses sync automatically and experiments start/stop without manual coordination.

Senior Backend Developer | Petrovich-Tech (petrovich.ru), e-commerce, remote **06.2022 – 04.2023**

A leading Russian DIY retailer and building materials supplier: 10,000+ customers including 8,000 contractors and 300 developers; e-commerce share of sales — 73% (2020).

- Synced 1M+ counterparties to Elasticsearch: designed the index for search-as-you-type by tax ID, handled deletions, added retry limits and rolled it out to production; built tax ID search suggestions on top of it.
- Built per-city Yandex YML product feeds and search suggestion feeds, reducing feed build time from 12–15 minutes to under a minute.
- Reduced the catalog update-tracking dataset from 4.9M records to 576K by tracking only active product-city records in a new Kafka-based pipeline; applied the same approach to product images.
- Introduced unit testing, PHPStan and PHP CS Fixer in the department, reducing manual checks of types, contracts and regressions when changing legacy code.
- Integrated callback requests with the Naumen contact center as a separate service, handling city time zones, expired slots and timeouts.
- Built a reconciliation tool to detect missing records and activity-status mismatches between the database and Elasticsearch across 874K records.

Senior Backend Developer | Autocod (avtocod.ru), Yekaterinburg **03.2021 – 03.2022**

Online vehicle history check service (by VIN or plate number), top-5 in its niche. 3.1M monthly visits, 50K DAU; aggregates data from 12 government and commercial sources.

- Cut the full test suite run from 12–15 to 5 minutes.
- Implemented car listing monitoring (“My searches”): saved searches by car parameters with change notifications, an endpoint to toggle saved-search activity, and subscribe/unsubscribe webhooks from an external listings service; traced wrong webhook URLs to a missing app URL variable on staging workers.
- Migrated the application to RoadRunner 2 and integrated Xdebug into the development environment, enabling conventional step-through debugging instead of ad-hoc runtime debugging.
- Replaced a third-party WebSocket SaaS with self-hosted Centrifugo, bringing real-time messaging infrastructure in-house and giving the team full control over notifications and server-to-client messaging.

Software Backend Developer | Profi.Travel, TravelTech, Yekaterinburg **02.2017 – 12.2020**

International B2B TravelTech platform and the largest media holding for the travel industry: operates across 11 markets and unites 140,000+ travel professionals.

- Built an embeddable real-time WebSocket chat on ReactPHP and Symfony for live broadcasts, reaching 5,000 requests per second in load testing.
- Optimized the portal home page by reducing DB queries from 50 to 20, lowering database load and response time.
- Moved bulk mailing for several thousand clients out of the monolith into a RabbitMQ-based service, removing CPU pressure from the main site and enabling horizontal scaling of the mailing workload.
- Moved deployment from developer-managed Capistrano/Capifony setups to GitLab CI and Deployer: removed per-developer environment and SSH-key configuration, made deployment access centrally manageable in GitLab, and made deployment logs available to the whole team.
- Introduced Docker for the main project and 5–6 seasonal projects per quarter, standardizing the development environment for a team of 5.
- Built workshop and webinar features including registration with referral tracking, unique-user view counters, post-event emails and video-player event tracking.
- Implemented one-time invitation links that allowed moderators to create accounts for external users and give them direct authenticated access without a registration flow.
- Assigned tasks to other developers, reviewed merge requests and owned deployments.

Software Backend Developer | Sima-Land (sima-land.ru), e-commerce platform, Yekaterinburg **07.2015 – 12.2016**

Top-15 online retailer. Wholesale supplier with 1M+ SKUs, delivery to 2,800 localities, 12,000+ employees.

- Built card acquiring with retried charges using exponential backoff; logging and alerts through ELK.
- Automated unit, integration, acceptance and API tests in CI with parallel runs and coverage reports, cutting the pipeline from 30 to 15 minutes.
- Created Docker images, a Makefile and docker-compose to standardize the team’s dev environment.
- Integrated export of the 1M+ product catalog to Yandex.Market and generated sitemap.xml for better indexing.
- Built dynamic breadcrumbs for the 1M+ product catalog with multi-category support.

EDUCATION

Ural Federal University named after the first President of Russia B.N. Yeltsin **2011 – 2015**
Bachelor’s degree, Software Engineering Yekaterinburg

Khakass State University named after N.F. Katanov **2004 – 2007**
Technician, Computer Software and Automated Systems Abakan

LANGUAGES

English: Intermediate (B1), **Russian:** Native speaker
