Kirill Cherednichenko | Senior Backend Developer (PHP)

+84 36 648 9942 | chekirilla@gmail.com | github.com/4irik | linkedin.com/in/kirill-cherednichenko | 4irik.github.io/log/en

Senior Backend Developer (PHP) with 14+ years in web development. I build and evolve backend systems: payment and billing modules, REST APIs and integrations, message queues (RabbitMQ, Kafka) and search (Elasticsearch). I focus on architecture, testability, reliability and observability. In personal projects I record architecture decisions as ADRs and work from specs with AI agents. Interested in backend roles with complex business logic, APIs and integrations.

Skills

Languages & Frameworks: PHP 5/7/8, Symfony, Yii2, Laravel, Slim, Doctrine ORM, ReactPHP, RoadRunner, PHPUnit, Codeception, PHPStan, PHP CS Fixer, Rector, TDD, **Databases & Search:** PostgreSQL, MySQL, Redis, Elasticsearch, ClickHouse, SQLite, **APIs & Integrations:** REST APIs, gRPC, WebSocket, OpenAPI, Payment Integrations, Telegram Bot API, **Messaging & Queues:** RabbitMQ, Kafka, Centrifugo, **DevOps & Observability:** Docker, Git, GitLab CI/CD, Deployer, Nginx, ELK Stack, Sentry

Experience

Senior Backend Developer / Technical Owner | IPSM (ipsm.kz), one-off project, remote **03.2026 – 04.2026**

International Kazakh-Israeli postgraduate medical education project (International Postgraduate School of Medicine), run jointly with Kazakh medical universities and the Israeli organization IHEA. Sole technical owner of a donation backend built from scratch: architecture, payments, API, testing, deployment and handover.

- Stood up a one-time payment acceptance service from scratch in 3 days: application skeleton, Docker environment and deployment; payment creation returning a checkout link, signature-verified callback processing in middleware and transaction storage.
- Built monthly subscriptions: card linking, recurring charges, retries and donor self-service cancellation.
- Made OpenAPI 3.1 the shared contract for backend code and tests (request validation, consistent API errors); covered key payment flows with unit, integration and API tests and set up static analysis.
- Made payment creation idempotent and protected CLI commands and database migrations from concurrent or duplicate execution.
- Set up cross-cutting logging: centralized rotating error logs for HTTP and CLI, diagnostic logging of payment gateway requests and responses with sensitive data masked.
- Automated deployment, migrations and rollback with Deployer so the client can release without an engineer.
- Added a Telegram bot for access to donation and subscription data, including CSV exports.
- Used Claude Code and Codex as development agents under repository-level rules, shared skills and explicit security checks for payment code.

Stack: PHP 8.3, PHP 8.5, Slim, SQLite, OpenAPI 3.1, Swagger, PHPUnit, Rector, Deployer, Telegram Bot API, Docker

Senior Backend Developer | Confidential, crowdsourcing platform (NDA), remote **12.2024 – 03.2026**

Private venture fund & development lab: company projects reach 10M+ active users. Backend of a modular crowdsourcing task platform: the application shell composes business modules from Git submodules and Composer packages.

- Replaced implicit dependencies with dependency injection and separated database queries from business logic with a repository layer (ActiveRecord): key modules can be tested in isolation.
- Designed a common module for task verticals: specialized task modules plug in through interface contracts without changes to the core.
- Implemented a state machine for tasks and executions: allowed transitions and guard rules from creation and moderation to dispute, acceptance or rejection.
- Designed and implemented time-based task scheduling: period-overlap validation, automatic switching and promotion of tasks.
- Implemented multi-currency payouts and refunds on internal accounts and correct billing of paid services across account currency changes, including currency conversion.
- Fixed a dispute-handling defect that could cause a negative balance after a task price increase.
- Built a modular messenger with extensible access rules, covered by unit, functional and acceptance tests.
- Set up quality gates: PHPStan, PHP CS Fixer, commit validation and separate Codeception configurations for different test layers.

Stack: PHP 8.0, PHP 8.3, Yii2, MySQL, Docker, Git submodules, Codeception, PHPStan, PHP CS Fixer, TDD, RabbitMQ

Senior Backend Developer | VK (VKontakte, vk.com), content team, remote **04.2023 – 07.2023**

Russia's largest social network by user count: MAU 93.4M, DAU 62.7M (2026 data).

- Implemented photo editor product analytics: server-side processing of client events, ClickHouse type mapping and event pipeline integration; found a type mismatch between the event schema and the analytics table.
- Designed backend APIs for ML-powered photo editing: segmentation masks and asynchronous photo enhancement via workers, with access and input validation.
- Rolled features out gradually through experiments and feature flags, monitoring API errors, RPC metrics and Sentry.
- Extended the AR masks service with per-mask capability flags while preserving backward compatibility: older clients continued to receive only compatible masks.
- Automated Jira ↔ internal A/B platform synchronization: experiment statuses, start and stop without manual coordination.

Stack: PHP 7, KPHP, ClickHouse, Sentry, Jira API, Message Queue

Senior Backend Developer | Petrovich-Tech (petrovich.ru), e-commerce, remote **06.2022 – 04.2023**

A leading Russian DIY retailer and building materials supplier: 10,000+ customers (8,000 contractors, 300 developers); e-commerce share of sales — 73% (2020).

- Synced 1M+ counterparties to Elasticsearch: search-as-you-type index by tax ID, deletion handling, retry limits and production rollout; built tax ID search suggestions on top of it.
- Built per-city Yandex YML product feeds and search suggestion feeds; reduced build time from ~20 minutes to ~1 minute.

- Reduced the catalog update-tracking dataset from 4.9M to 576K records by tracking only active product-city pairs in a new Kafka-based pipeline; applied the same approach to product images.
- Introduced unit testing, PHPStan and PHP CS Fixer in the department, reducing manual checks of types, contracts and regressions in legacy code.
- Built a separate service integrating callback requests with the Naumen contact center: city time zones, expired slots and timeouts.
- Built a reconciliation tool for the database and Elasticsearch that finds missing records and activity-status mismatches (~874K records).

Stack: PHP 7, Elasticsearch, Kafka, PostgreSQL, Redis, PHPUnit, PHPStan, PHP CS Fixer, TDD, GitLab CI/CD

Senior Backend Developer | Autocod (avtocod.ru), Yekaterinburg **03.2021 – 03.2022**

Online vehicle history check service (by VIN or plate number), top-5 in its niche: ~3.1M monthly visits, 50K DAU; data from 12 government and commercial sources.

- Cut the full test suite run from 12–15 to 5 minutes: PCOV instead of Xdebug for coverage, removed unnecessary database and framework initialization in tests.
- Built "My searches" (car listing monitoring) from scratch: saved searches by car parameters, toggling search activity, subscribe/unsubscribe webhooks from an external listings service, and cumulative and real-time notifications (Telegram, email).
- Migrated the application to RoadRunner 2 and set up Xdebug in the dev environment: step-through debugging instead of ad-hoc.
- Replaced a third-party WebSocket SaaS with self-hosted Centrifugo: real-time messaging and notifications under company control.

Stack: PHP 7, Laravel, Codeception, PostgreSQL, gRPC, WebSocket, TDD, GitLab CI/CD, Sentry, Docker

Software Backend Developer | Profi.Travel, TravelTech, Yekaterinburg **02.2017 – 12.2020**

International B2B TravelTech platform and the largest media holding for the travel industry: operates across 11 markets and unites 140,000+ travel professionals.

- Built an embeddable real-time WebSocket chat from scratch on ReactPHP and Symfony for live broadcasts: ~5,000 RPS in load testing.
- Optimized the portal home page: DB queries cut from 50 to 20, server response time at peak load reduced from 2 s to 300 ms.
- Moved bulk mailing (several thousand clients) out of the monolith into a RabbitMQ-based service: removed CPU load from the main site and enabled horizontal scaling.
- Moved deployment from Capistrano/Capifony to GitLab CI and Deployer: no per-developer environment or SSH-key setup, access managed in GitLab, deployment logs available to the whole team.
- Introduced Docker for the main project and 5–6 seasonal projects per quarter, standardizing the dev environment for a team of 5.
- Initiated Sentry adoption and integrated it across projects, enabling proactive error monitoring and faster detection of rare issues before users reported them. Configured deprecation logging to support the Symfony 2.8 → 3.4 migration and prepare for future upgrades.
- Built workshops and webinars (registration with referral tracking, unique view counters, post-event emails, video-player event tracking) and one-time invitation links for external users.
- Assigned tasks to other developers, reviewed merge requests and owned deployments.

Stack: PHP 5, PHP 7, Symfony, Doctrine ORM, ReactPHP, RabbitMQ, MySQL, Sentry, Docker, GitLab CI/CD, Deployer, TDD

Software Backend Developer | Sima-Land (sima-land.ru), e-commerce platform, Yekaterinburg **07.2015 – 12.2016**

Top-15 online retailer. Wholesale supplier with 1M+ SKUs, delivery to 2,800 localities, 12,000+ employees.

- Built acquiring with payment holds and retried charges using exponential backoff; logging and alerts through ELK.
- Automated unit, integration, acceptance and API tests in CI with parallel runs and coverage reports, cutting the pipeline from 30 to 15 minutes.
- Created Docker images, a Makefile and docker-compose for a unified team dev environment.
- Built export of the 1M+ product catalog to Yandex.Market, sitemap.xml generation and dynamic breadcrumbs with multi-category support.
- Implemented collection and batched delivery of data on products users actually viewed to an internal product analytics platform.

Stack: PHP 5, PHP 7, Yii2, Codeception, TDD, ELK, Sentry, Docker

Education

Ural Federal University named after the first President of Russia B.N. Yeltsin **2011 – 2015**
Bachelor's degree, Software Engineering Yekaterinburg

Khakass State University named after N.F. Katanov **2004 – 2007**
Technician, Computer Software and Automated Systems Abakan

Languages

English: Intermediate (B1), **Russian:** Native speaker
